Legion Health · Founding product take-home

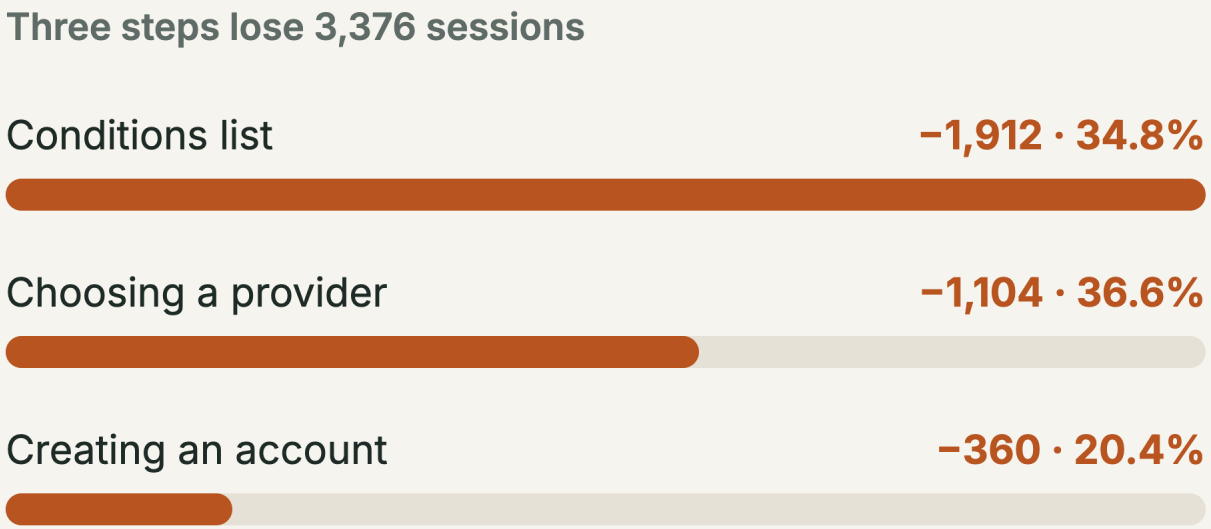

AI-native onboarding experience

From first click to first visit completed

Today: Multiple screens, and most patients never reach payment

23.8%

of 5,898 sessions reach the payment page. Nothing is tracked after it.

Why it matters, and why now

~360 more patients/month

reach checkout if start → payment rises from 24% to 30%. No new acquisition spend.

The data layer is already paid for

Metriport, Sohar and DoseSpot are live today. Intake just doesn't use them.

The product contradicts the pitch

Legion sells AI-native psychiatry. Rula books in ~3 min and Grow in ~10, both with cost shown first.

Cheap to change, easy to measure

Front end plus orchestration of existing vendors. The funnel is already instrumented.

Solution: pull and then confirm (HITL)

Patient demographics

Phone
Date of birth
One consent

→

Identity, address
Verified

Insurance, copay
Sohar

Past diagnoses
Metriport · never blocks

Medication fills
DoseSpot

→

Patient confirms

Fixes anything wrong

If the pull doesn't work out →The patient answers.

Seven screens, through the first visit

1	2	3	4	5	6	7	✓	★
Start	**Confirm**	**Safety**	**Concerns**	**Snapshot**	**Provider**	**Book**	**Booked**	**Visit done**
Phone, birth date	Pre-filled + copay	Always asked	AI tags free text	Records + meds	Ranked list	Consents read to end	Texts sent	North star

Why seven: the fewest screens where each one does a single job

Multiple screens · today

Asks for data Legion can already pull. Every extra screen is another chance to leave.

7 screens · chosen

One job per screen, safety kept separate, and every step measurable end to end.

Key decisions: one source per job

Identity

Verified only

Name, address, Texas check; finds the insurer. Not Persona: cost, privacy, conflicting data.

Insurance

Sohar

Verifies plan and copay; built for behavioral-health carve-outs. The only cost source shown.

Records

Metriport

Past diagnoses and hospital stays from HIE networks. Runs in the background; never blocks.

Medications

DoseSpot

Fill history and pharmacy. Three medication screens become one confirm.

AI where it helps: AI turns the patient's own words into a fixed concern list, with a keyword fallback.

Doubt goes to a human: missing or conflicting data becomes a question for the patient.

Trade-offs I chose

1

Speed vs readiness

Chose readiness

Book-first flows like Rula and Headway get people into a slot faster. I put safety and intake before booking, because the finish line is a completed first visit, not a booking. A slot taken by someone who needs a higher level of care, or who arrives with no history, is a wasted slot.

2

Clicks vs safety

Chose safety

We pull insurance, meds and records at every step, but never use them silently. That costs a few clicks. In psychiatry a wrong medication history is a prescribing risk, so confirmation is the price of being AI-native safely.

3

Conversion vs transparency

Chose transparency

Showing the copay on screen 2 may lose some people early. Today they leave at step 11, after ten minutes. I'd rather they decide in thirty seconds. If completed visits per start don't rise, we revert.

How we'll know it worked

Type	Metric
North star	Start → first visit completed
Primary	Start → booked
Secondary	Fields the patient types
Secondary	Median time to book
Secondary	Pre-filled data confirmed without edits
Guardrail	Booked → first visit completed
Guardrail	Safety screen answered
Guardrail	Manual fallback rate

New events, mapped to Legion's portal.* names: screen_out, verified_no_match, records_ready_at_screen_4, manual_fallback, booked, visit_joined, visit_completed.

How I built it with Claude and Claude Code

1 · Plan

Claude

- Mapped the funnel and drop-offs
- Researched competitors and vendors
- Wrote the PRD
- Designed mobile and web flows
- Wrote the build spec and synthetic test data

→

2 · Build and ship

Claude Code

- Built the repo on GitHub, in small commits
- One mock adapter per vendor, 6 scenarios
- Playwright tests, run in CI
- Deployed to Vercel, tested live, fixed 2 bugs
- Opened the pull request

→

Throughout · In the loop

Me

- Made every product call
- Reviewed and corrected each step
- Set up accounts, keys and access
- Kept every prompt in the AI history

What's submitted

Live prototype	legion-onboarding-theta.vercel.app
Open pull request	github.com/Shubhaach/legion-onboarding/pull/2
PRD	Product requirements, with appendix
Designs	Mobile options and the final web flow
AI history	docs/ai-history/ in the repo, redactions labelled
Tests	One per scenario, passing in CI and on the live URL
